

Our World in 2030

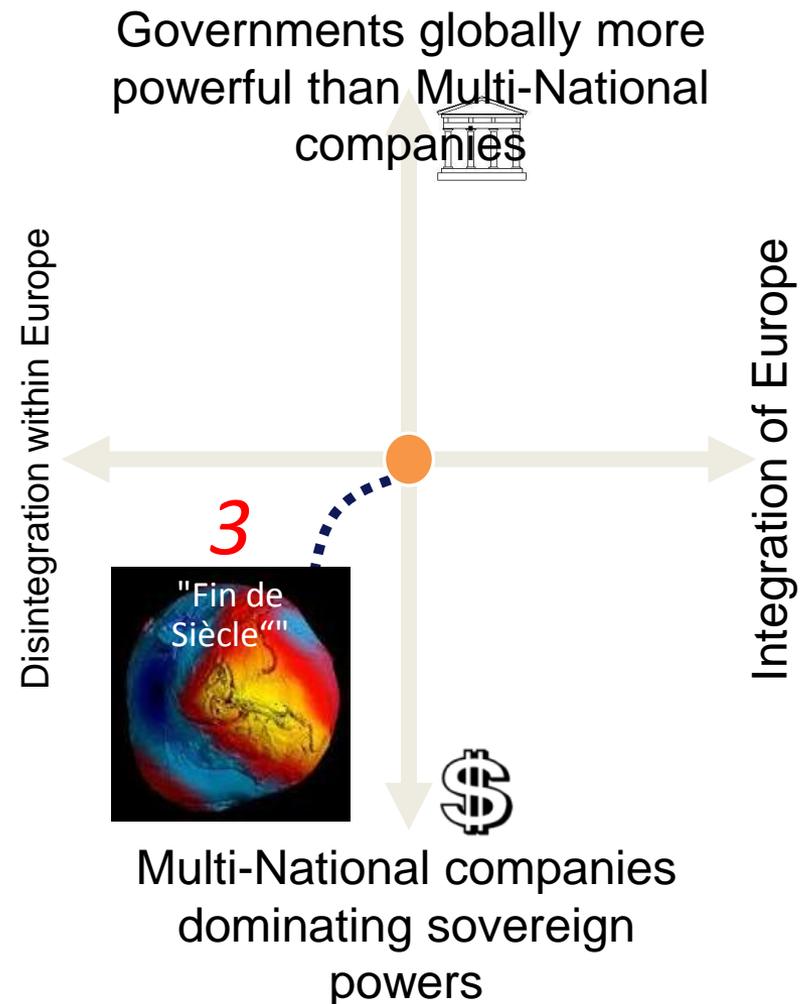

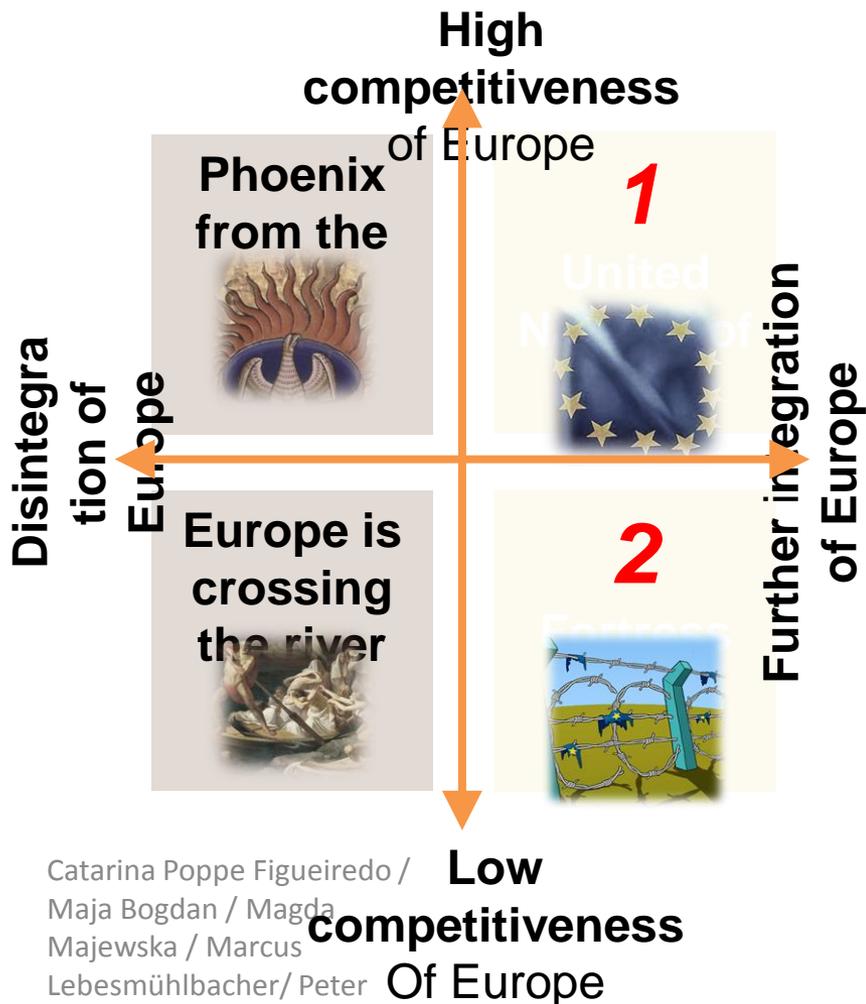

Scenarios on the future trends of globalization are developed in 3 student teams. Each team has to present its considerations in three development stages. The following charts show examples from various final presentations since 2008.

Definition of scenarios – Basic directions

Scenarios prepared in 2011

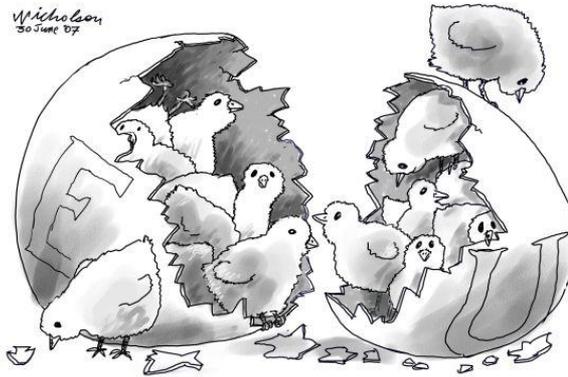

The worst case scenario: The European catastrophe

Introduction

Integration

“United World, United Europe”

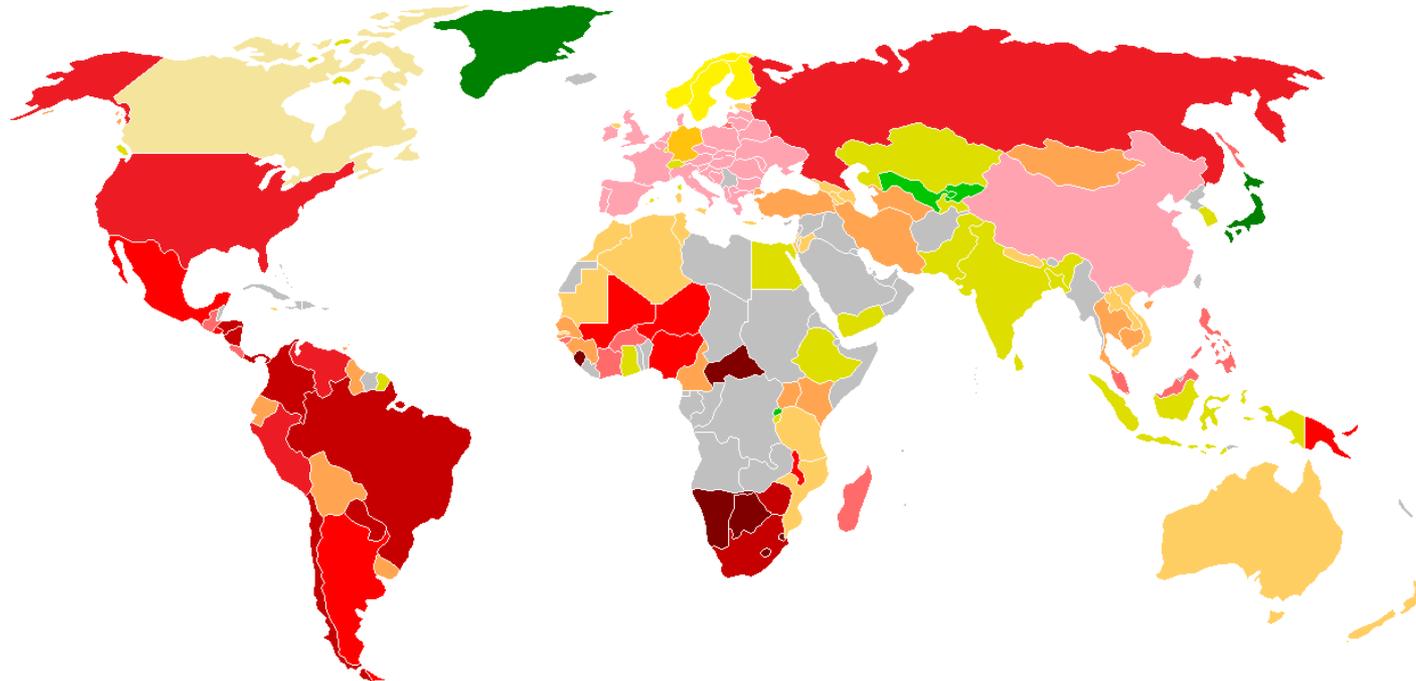

Protectionism

Liberalization

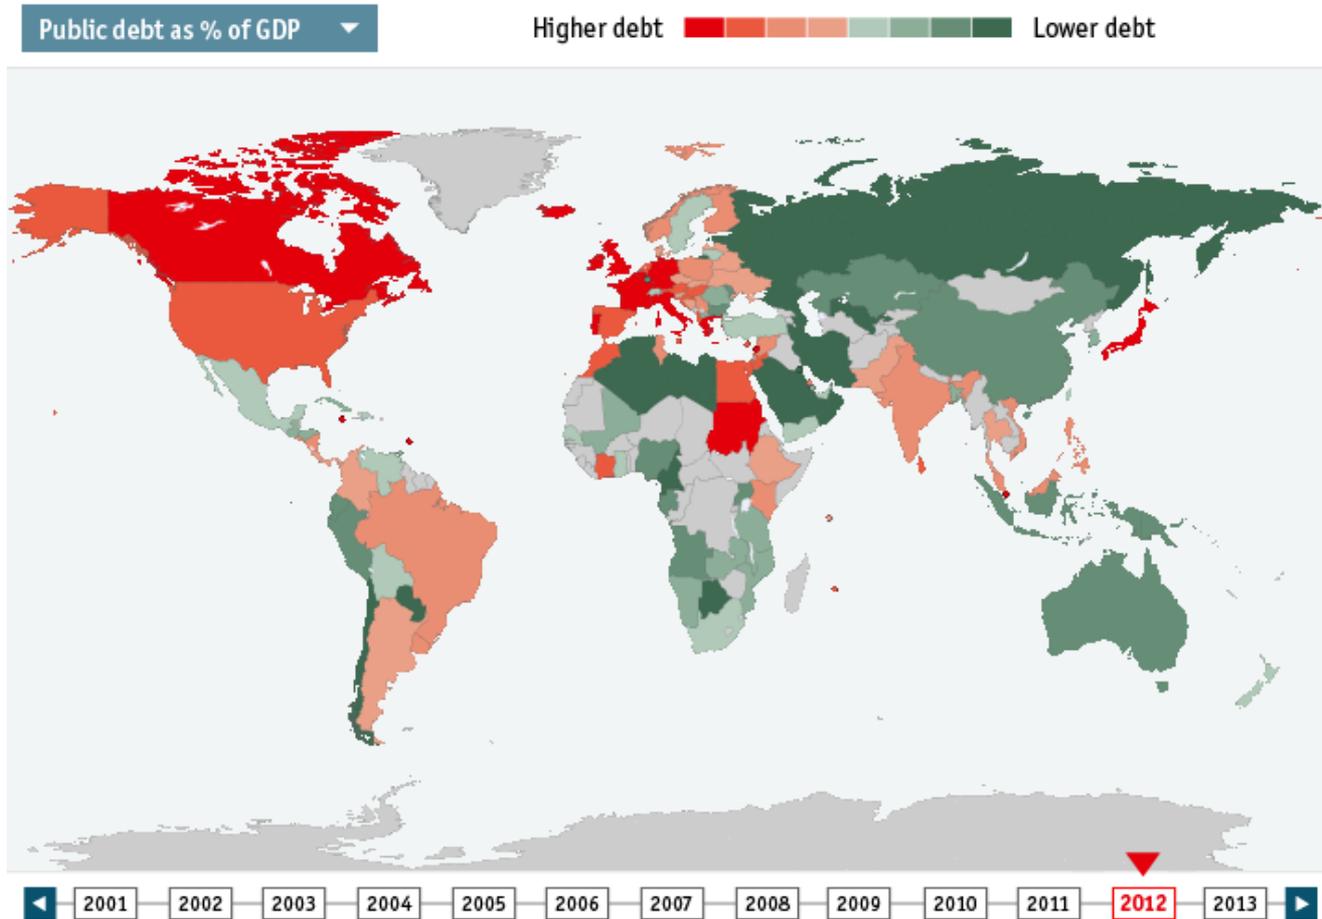

Desintegration

Austerity measures and urbanization increase poverty and income inequality drastically which leads to increased power for populist political parties

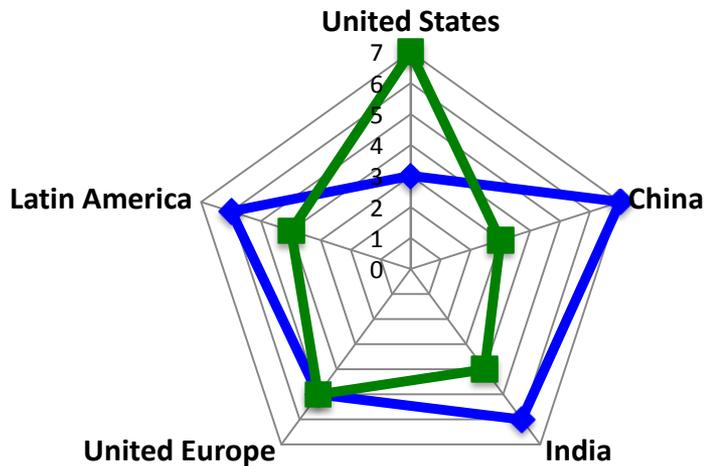

Color	Gini coefficient		0,35 - 0,39		0,55 - 0,59
	< 0,25		0,40 - 0,44		> 0,60
	0,25 - 0,29		0,45 - 0,49		NA
	0,30 - 0,34		0,50 - 0,54		

The paradigm shift in economic centers leads to increased public debt in the former economic powers

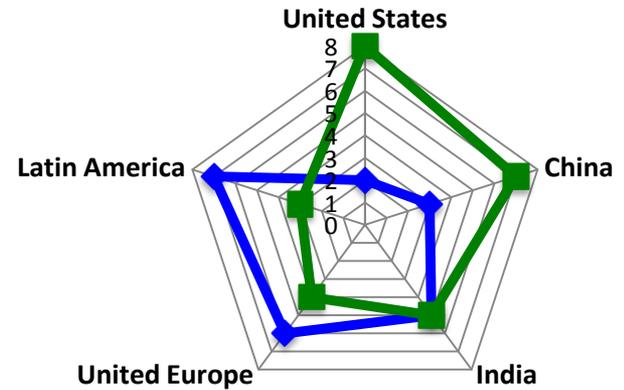

“Me!” vs. “Us!”

Socialism vs Capitalism - NOW

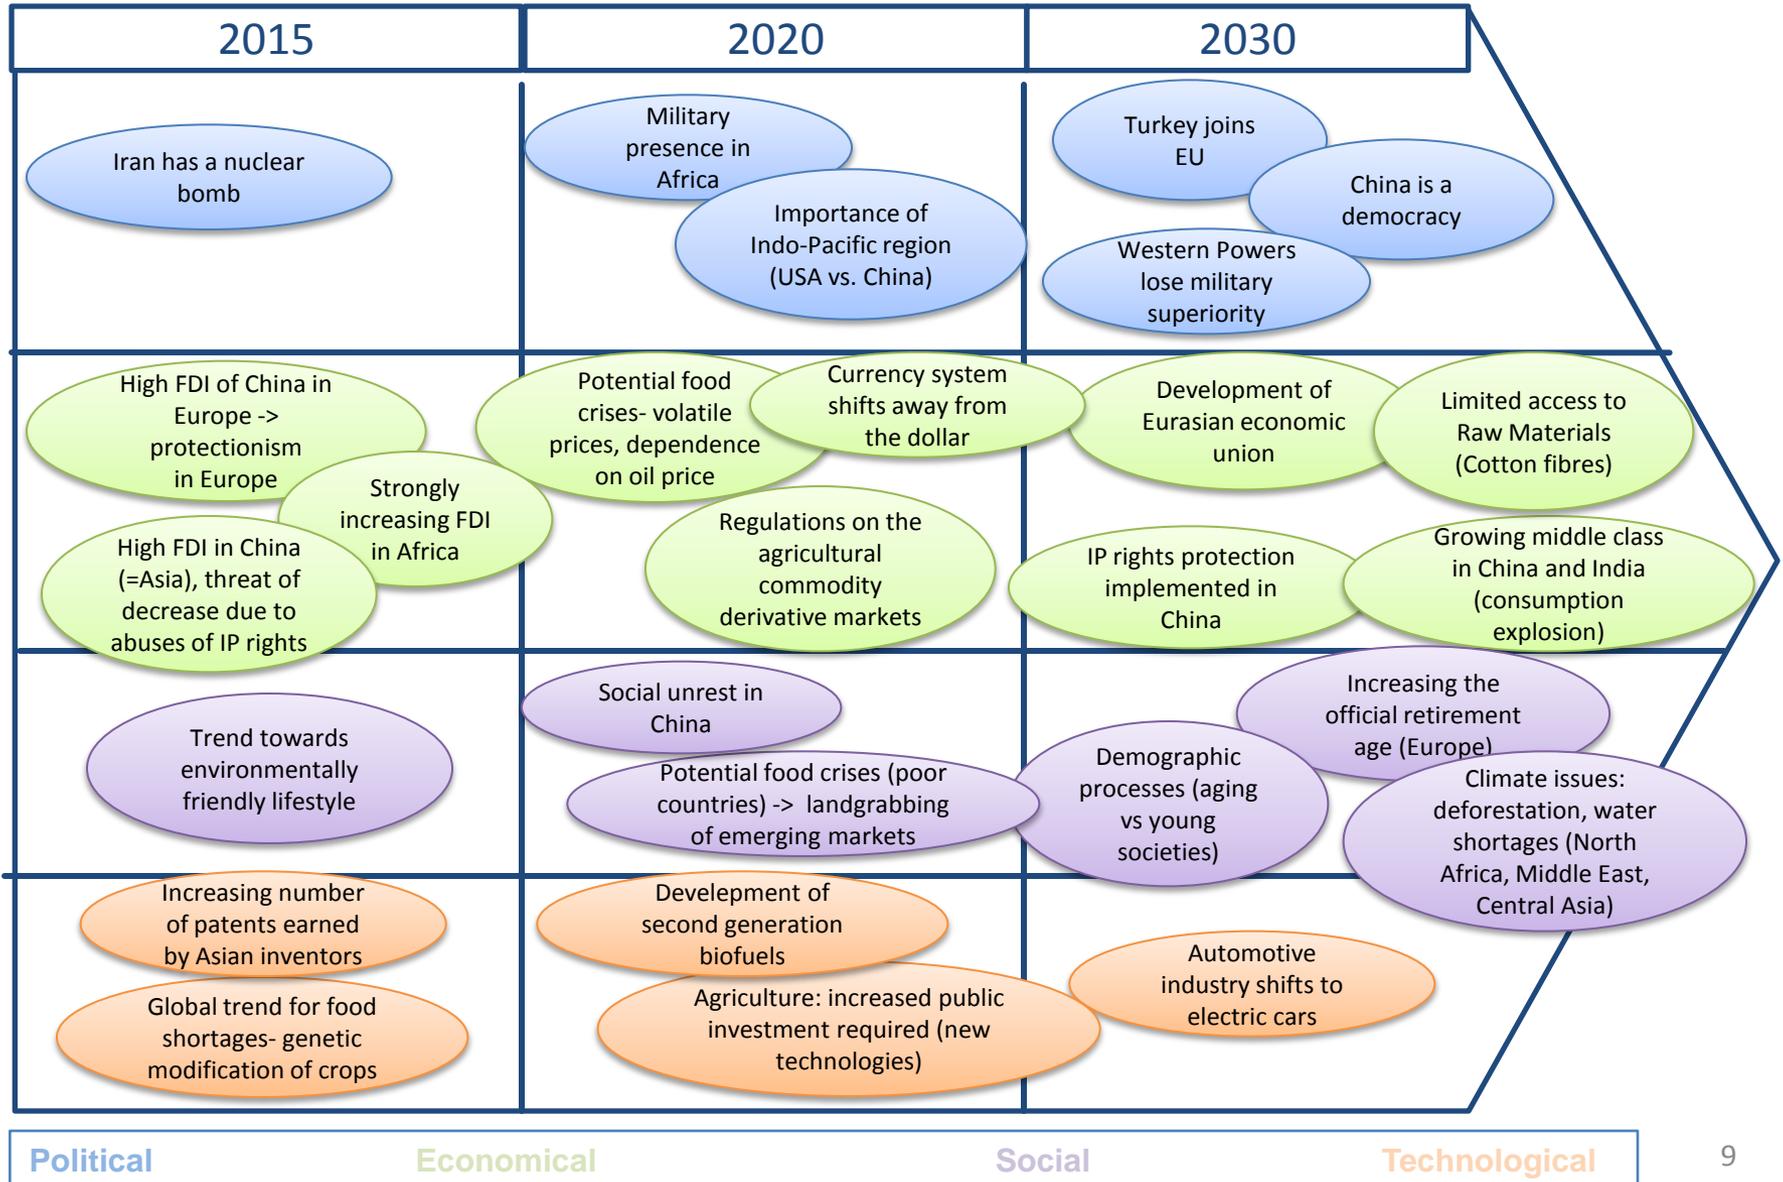

◆ Socialism ■ Capitalism

Socialism vs. Capitalism 2030

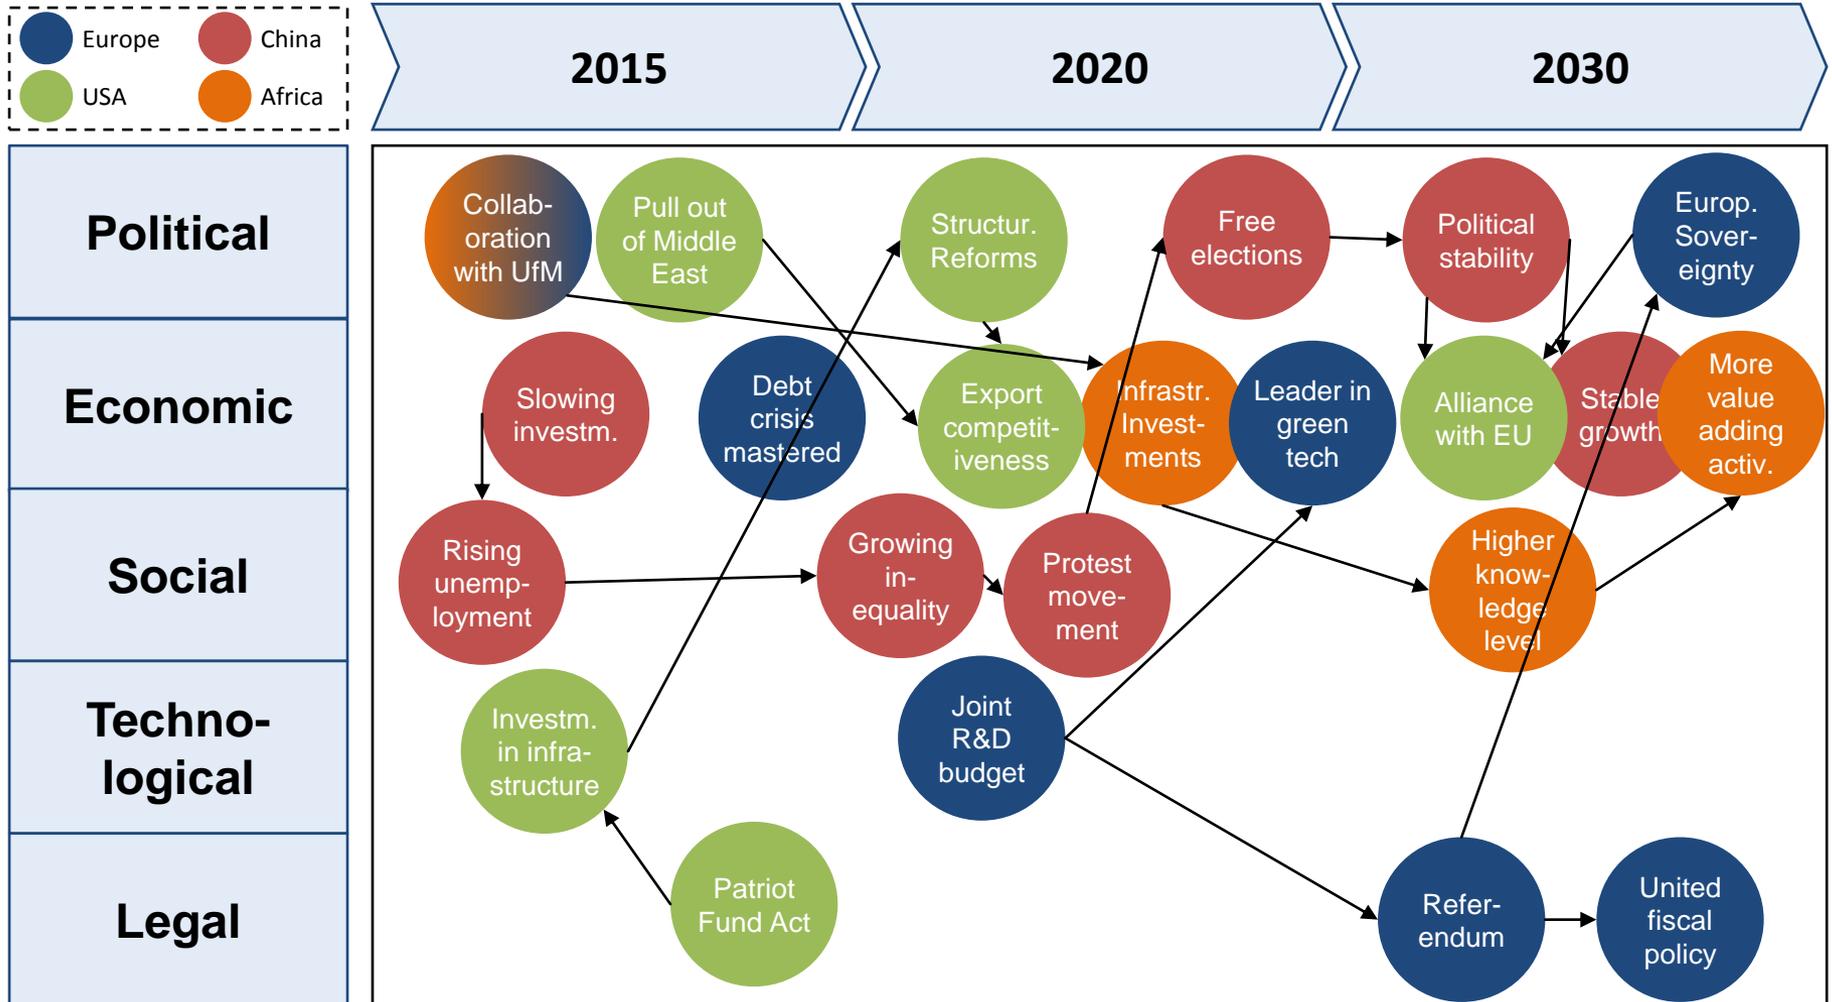

◆ Socialism ■ Capitalism

DEVELOPMENTS IN THE WORLD

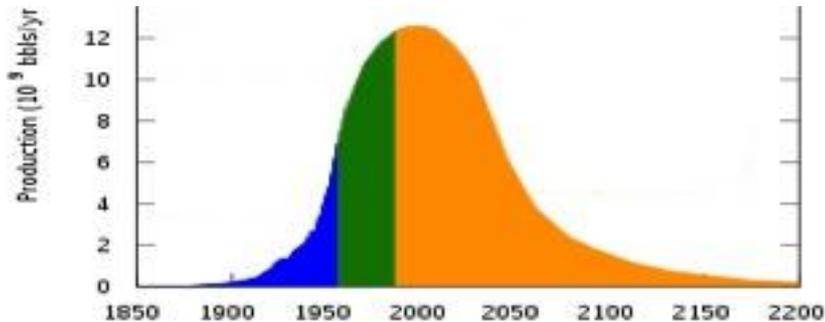

Referendum

Various European and world-wide events lead to a high integration in Europe and the willingness to give up national sovereignty

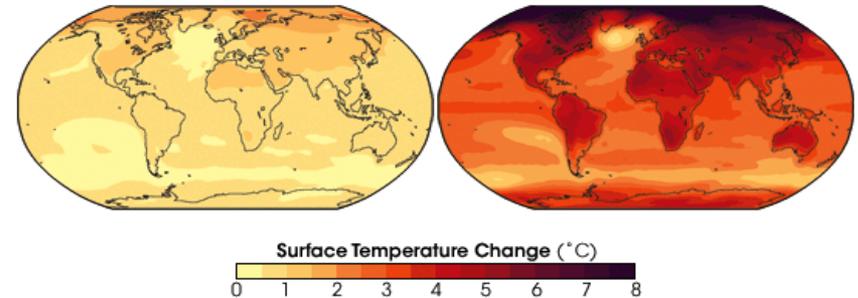

Natural disasters and a crude oil supply crunch in 2020 initiate a paradigm shift in energy supply

Peak oil

- Peak oil in **2015**: maximum rate of global petroleum extraction is reached
- By **2020**: oil supply crunch observable: Crude oil is becoming increasingly scarce
- Severe oil shortage in **2030**: demand: 118 mbpd, supply: 100mbpd
- Investments in renewables start to pay off
- Europe is leading in green technology

2030 Surface Temperature Change

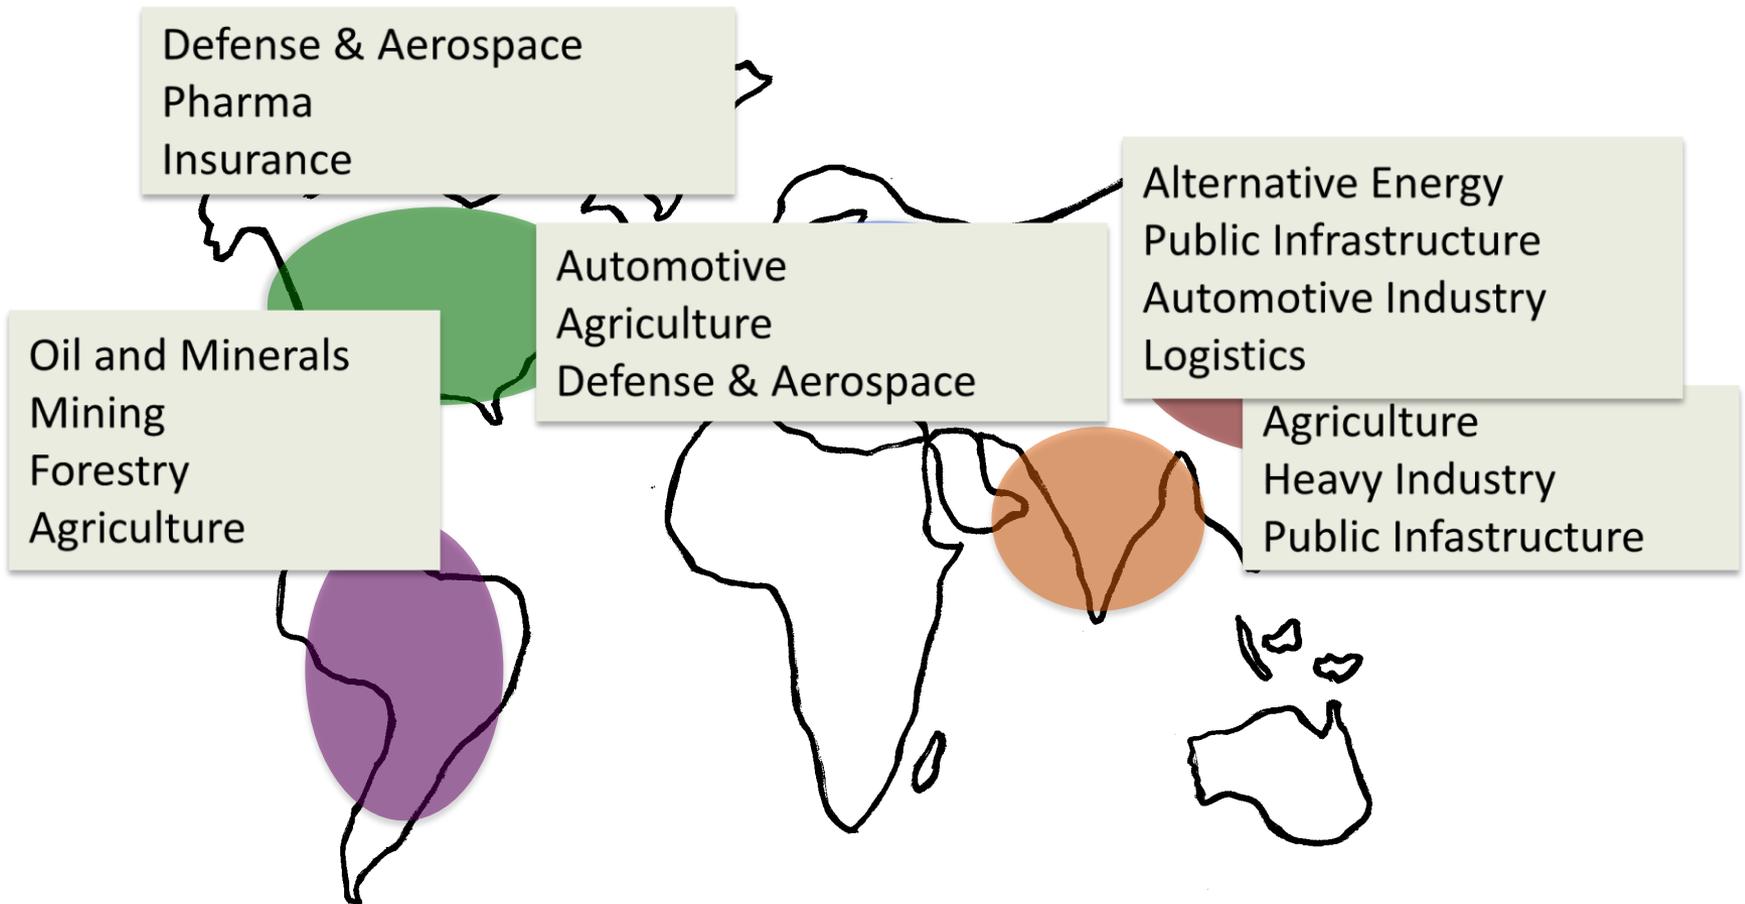

- “Lost decade” for environmentalism. Attention and financial resources focused on global economic crisis.
- Devastating natural disasters in the 2020ies due to global warming
- China sources 15% of its energy from non-fossil fuels
- **FCCC Beijing Agreement on GHG Emissions**: 194 signatory states: including US and China

- Oil continues to play an important role in the next 20 years. However in the frantic search for alternatives, green energy sources are becoming more efficient and cheaper
- European renewable energy companies benefit from escalating crude oil prices, rising energy demands and paradigm shift initiated by the FCCC Beijing Agreement on GHG Emissions

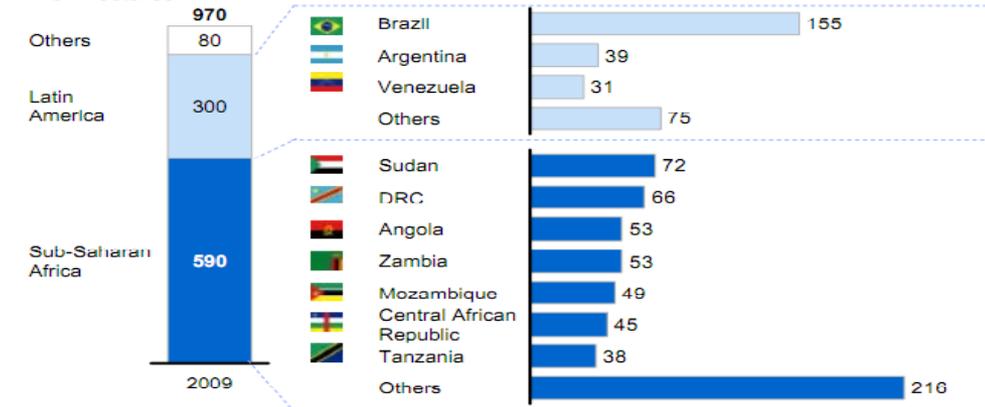

What Matters in 2030

AFRICA'S POTENTIAL: LAND AND LABOR RESOURCES

Africa represents about 60 percent of the potentially available cropland in the world

Additional available cropland, 2009¹
Million hectares

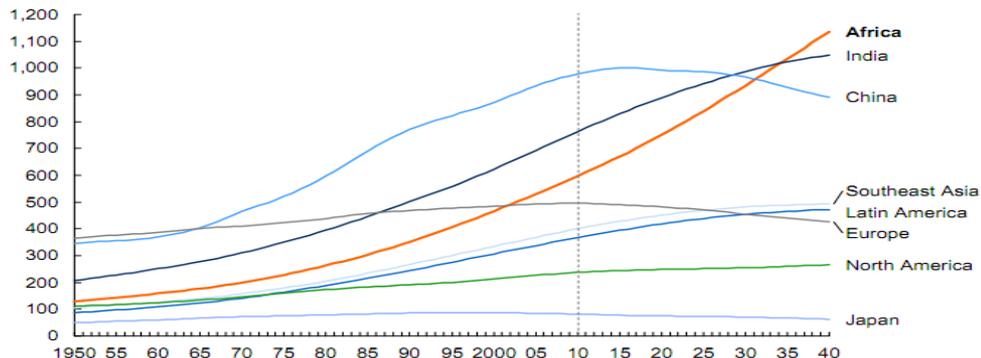

¹ Cropland defined as land producing output greater than 40% of maximum yield under rain-fed conditions, excluding forest areas.

SOURCE: World Bank/Food and Agriculture Organization, *Awakening Africa's sleeping giant*; McKinsey Global Institute

Agriculture:
further land
expansion in Africa

Africa's workforce will become the world's largest by 2040

Size of the working-age¹ population
Million

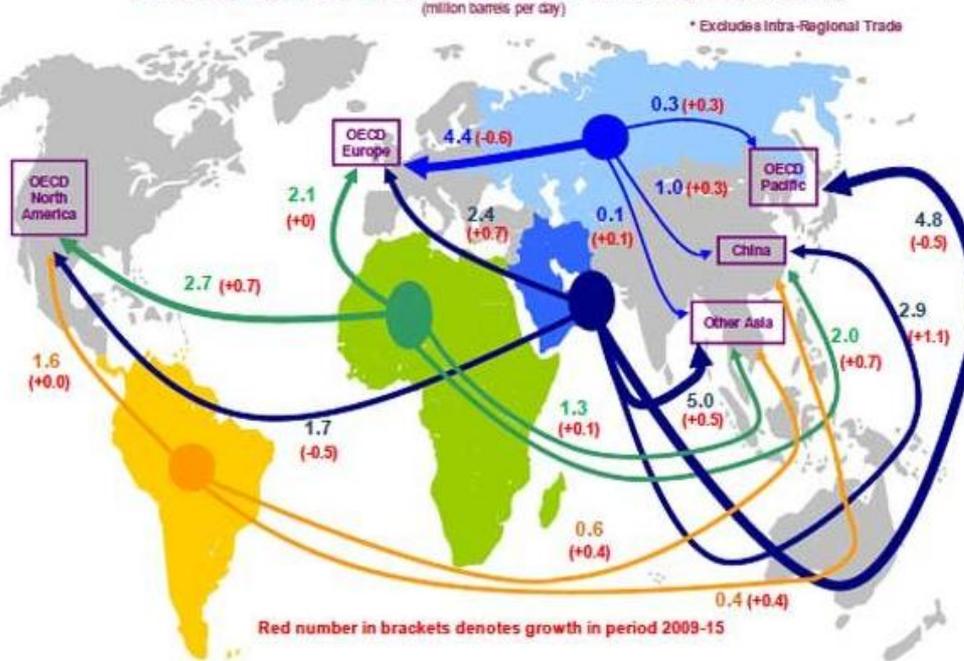

¹ Population aged 15-64.

Huge work labor
potential

ENERGY MARKET OUTLOOK: CHANGES IN ENERGY SOURCE

Crude Exports in 2015 and Growth in 2009-15 for Key Trade Routes*
(million barrels per day)

Evolution of Import Dependency by Region

Source: IEA

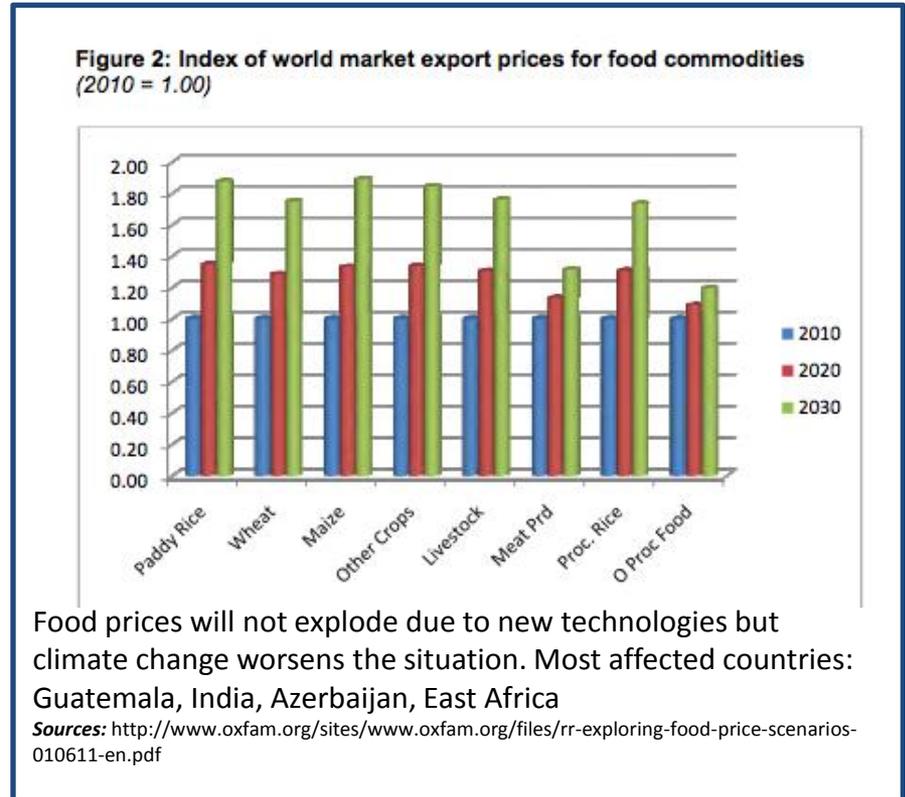

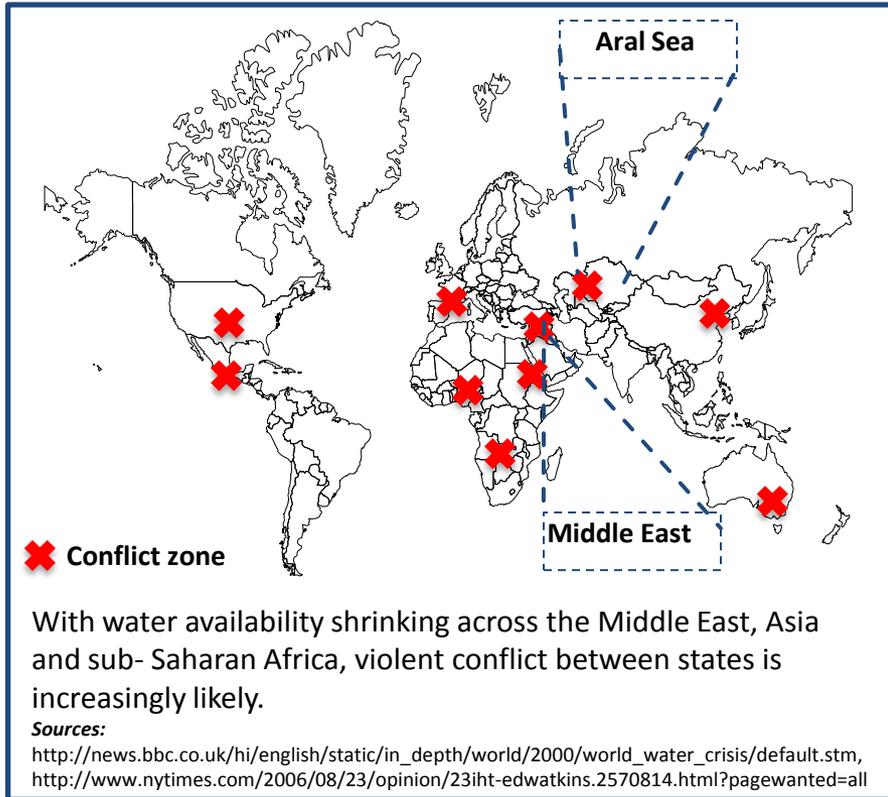

European oil supply becomes more balanced – less Russia, more Middle East

Import diversification – decreasing source dependency – security in energy supply

European dependency on liquid natural gas rises

Significant shift towards a more environment friendly technology

Two potential sources of conflict in the year 2030.

The world of 2030 will experience scarcity of basic goods which leads to higher prices

- Country's also seek partnerships to secure food and water supply
- Less disposable income for consumers as they spend more for food
